3. FILTER CALCULATION / SIZING

The total pressure drop of a filter at a certain flow rate \( Q \) is the sum of the housing \( \Delta p \) and the element \( \Delta p \) and is calculated as follows:

\[
\Delta p_{\text{total}} = \Delta p_{\text{housing}} + \Delta p_{\text{element}}
\]

\[
\Delta p_{\text{housing}} = (\text{see Point 3.1})
\]

\[
\Delta p_{\text{element}} = Q \cdot SK^* \cdot \text{viscosity} \times 1000
\]

(*see point 3.2)

For ease of calculation, our Filter Sizing Program is available on request free of charge. NEW: Sizing online at www.hydac.com

3.1 \( \Delta p-Q \) HOUSING CURVES BASED ON ISO 3968

The housing curves apply to mineral oil with a density of 0.86 kg/dm³ and a kinematic viscosity of 30 mm²/s. In this case, the differential pressure changes proportionally to the density.

3.2 GRADIENT COEFFICIENTS (SK) FOR FILTER ELEMENTS

The gradient coefficients in mbar/(l/min) apply to mineral oils with a kinematic viscosity of 30 mm²/s. The pressure drop changes proportionally to the change in viscosity.
